HACKATHON

PROBLEM STATEMENTS

SPONSORED PROBLEM STATEMENT BY KOED

PROBLEM STATEMENT :

Build a Networking and Event Management Platform for Students, College Clubs, Societies, and Companies Overview: Develop a platform for students, college clubs, societies, and companies to engage in hackathons and innovation challenges. Students can discover, register, and participate in events, while clubs and societies can host and manage these events. Companies can offer sponsorships to support college events.

KEY FEATURES :

1. **Hackathon Registration** : Students can easily register for hackathons and competitions hosted by universities, organizations, and companies.
2. **College Clubs & Societies** : Clubs and societies can create profiles, host hackathons, and collaborate with students and other clubs.
3. **Corporate Sponsorships** : Companies can offer sponsorships for college events, helping clubs secure funding.
4. **Email Notifications** : When a new hackathon is registered, associated institutions, clubs, societies, and companies receive automatic email notifications with event and sponsorship details.
5. **Hackathon Dashboard** : Students and clubs can track registrations, deadlines, team progress, and event updates.
6. **Search & Filtering** : Users can search for events, sponsorships, and collaborations based on skills, interests, and location.
7. **Event & Sponsorship Management** : Clubs can manage events and view sponsorship offers from companies.

OTHER PROBLEM STATEMENTS :

Problem -1 : Develop an automated bot to enhance meme coin trading by addressing inefficiencies like arbitrage opportunities, slippage, frontrunning bots, sentiment-based trading, and risk management. The bot should optimize strategies for price discrepancies, liquidity fluctuations, and volatility, improving trading efficiency and profitability.

Problem - 2 : Develop an AI-powered Mess Entry Monitoring System using cameras to automatically count individuals entering a mess hall. The system should accurately track people, handle occlusions, filter out non-human objects, and provide real-time updates for analysis. Optional features include facial recognition or RFID for identity verification and duplicate detection.

Problem - 3 : Develop a solution to combat counterfeit medicines in India by ensuring authenticity and traceability across the supply chain. Use technologies like blockchain, AI/ML, or IoT for transparency. Create an easy-to-use system for consumers and authorities to identify fake drugs, ensuring scalability and accessibility, especially in rural areas.

Problem - 4 : Create a platform that connects food suppliers with local food banks and non-profits to redistribute near-expiry or surplus food. Using data analytics, optimize rescue routes and minimize transportation costs, ensuring timely and efficient redistribution to communities in need while preventing food waste.

OTHER PROBLEM STATEMENTS

Problem – 5 : Create a secure, automated platform for accrediting and certifying MSMEs. The platform should validate the quality of their work to ensure trust in cross-border trade. It aims to streamline the certification process and enhance transparency. Ultimately, this will accelerate trade connectivity between Singapore and India.

Problem – 6 : Develop technical solutions to address women's safety, including preventing crimes, providing personal defense, and aiding in crime reporting. Innovations can include hardware, software, or a combination of both. The aim is to combat violence, harassment, trafficking, and abuse against women.

Problem-7 : Develop a secure, scalable online portal for colleges to upload and manage semester results. The system should allow students to securely log in, view their own results, and receive notifications. It must ensure data privacy, support large user loads, and offer downloadable/printable result sheets. College admins should have search and filtering options for managing results.

NOTE : If possible kindly dockerize your application for scalability purpose.
